

# BridgeCom Systems TL-NET Turbo

Introducing the TL-NET Turbo by BridgeCom Systems, Inc. TL-NET Turbo is an innovative application for the MotoTRBO communication system. It provides a communication link between any radio system and MotoTRBO through BridgeCom Systems TL-NET system.

The TL-NET Turbo application provides a link to BridgeCom Systems' TL-NET system. This allows a radio talk group to communicate with and be party to a MotoTRBO talk group. Simply key the MotoTRBO radio and it will key the prescribed two-way talk group. The TL-NET system allows links to many RF bands and popular systems like conventional, LTR, Passport, Smartnet Smartzone, and more.

TL-NET combines all the features of single-site two-way radio communications with our VoIP backbone to provide a multi-site communication solution. Setup between sites is extremely fast! In fact, just as fast as handshaking with the local site.
